The Story in One Slide

The budget was reduced.
The channel kept delivering. This is not a performance story. It is a budget story.

1

Investment dropped 53% from January to November from R\$ 326K in January to R\$ 152K in November

2

Site traffic grew 41% while RTB investment was cut in half
Daily tags went from 10.3M in January to 14.6M in November

3

ROAS held stable at 15 throughout the entire period, moving from 15.85 in January to 15.51 in November with only 2.2% variation across the year.

Clicks vs Site Traffic - Diverging Trends 2025

CLICKS

➔ Fell 36% from January to November on a quarterly average basis. Performance was volatile across the period, with visible peaks during seasonal events and a general downward trend outside those windows.

SITE TRAFFIC

➔ Grew 41% from January to November. Growth was not linear, with visible spikes and drops throughout the period.

CPC – Efficient Cost, Shrinking Investment

Impressions remained stable at 1.3M daily average from January to November. The inventory was available and the reach was there. What changed was how much was invested to capture it

CPC DROPPED 7% FROM JANUARY TO NOVEMBER. Daily values stayed between R\$ 0.10 and R\$ 0.20 on most days. Average media costs decreased over time.

CTR DROPPED 29.8% from 1.87% in January to 1.24% in November. Correlation with investment is minimal. The available data does not explain the cause. Further investigation is needed.

Conversions – Volume Follows Investment

RTB conversions closely followed budget levels throughout the period.

RTB CONVERSIONS Volatile from January to November. Performance fluctuated across the period in line with investment levels. The main driver was budget allocation.

TOTAL SITE CONVERSIONS Grew 27% from January to November while RTB conversions declined.

AOV STAYED RELATIVELY STABLE from R\$ 277 in January to R\$ 316 in November, with the buyer profile remaining consistent throughout the period. Fewer conversions reflected less investment, not a shift in consumer behavior.

RTB Share – A Mathematical Outcome

Share dropped from January to November

RTB investment reduced across the period

Total site conversions grew independently

Share measures allocation, not performance. As investment declined and total site conversions grew, the metric followed naturally. The real question is not why share dropped but what the channel delivered with the budget it had.

Traffic Patterns – Seasonal and Weekly Behavior

Site traffic followed predictable patterns across the period. Seasonal events and weekly cycles both left clear signals in the data.

SEASONAL EVENTS CONFIRMED

Consumer Day, Fathers Day and Black Friday all generated visible traffic spikes from January to November. RTB conversions peaked during the same windows.

VOLUME DROPS ON MONDAY AND SUNDAY

Monday and Sunday are consistently the weakest days. Monday averages 90 RTB conversions per day compared to 195 on peak days, a drop of over 50%.

ENGAGEMENT QUALITY REMAINED CONSISTENT

CTR remains stable throughout the week at around 1.56%. The drop on slow days is a volume issue. Not an engagement issue.

WEDNESDAY TO SATURDAY ARE PEAK DAYS

Wednesday to Saturday consistently deliver the strongest results across impressions, clicks and RTB conversions throughout the period.

RTB Conversions by Day of Week — Daily Average 2025

Daily average RTB conversions by day of week from January to November 2025. Monday and Sunday consistently underperform. Peak performance from Wednesday to Saturday.

Key Correlations – The Channel is Predictable

Three key correlations were calculated to understand the relationships driving channel behavior.

RELATIONSHIP	DIRECTION	STRENGTH	WHAT IT MEANS
Investment vs RTB Conversions	Direct	Strong	Budget drives volume. More investment means more conversions.
Investment vs ROAS	Inverse	Moderate	Periods with higher investment showed slightly lower ROAS. This is a moderate and expected pattern for performance channels.
Site Traffic vs RTB Conversions	Inverse	Minimal	Site growth does not drive RTB results. The two operate independently.

The data reveals a predictable and efficient channel. Every major volume drop traces back to a reduction in investment, while ROAS and AOV remained stable throughout the period. The site grew independently and RTB performance remained relatively stable despite lower investment levels. Share declined as a natural consequence of these dynamics and should be analyzed alongside investment levels for a more complete view of channel health.

Recommendations – What the Data Is Saying

Actions to improve efficiency based on
what the data shows.

EVALUATE REINVESTMENT OPPORTUNITY

ROAS held stable at 15 throughout the period. The channel demonstrated consistent efficiency. A controlled budget increase with performance monitoring is worth evaluating.

INVESTIGATE CTR DROP

A 29.8% decline with minimal correlation to budget. The available data does not identify the cause. A refresh or segmentation test is the next logical step.

BUILD A SEASONAL BUDGET CALENDAR

Three seasonal events generated the strongest RTB results throughout the year. Consumer Day drove a 109% increase in RTB conversions, followed by Fathers Day with a 77% increase and Black Friday with a 79% increase versus the overall daily average. Concentrating budget during these periods would help capture peak demand and maximize returns without increasing annual spend.

ADJUST BID STRATEGY BY DAY OF WEEK

Monday and Sunday consistently underperform. Redistributing budget toward Wednesday to Saturday would improve efficiency without increasing total spend.

The insights presented in this deck are supported by a complete technical analysis. All calculations, methodology, visualizations and SQL queries are fully documented and available in the GitHub repository.
